LINDQVIST et al.

Atty. Ref.: 1410-679; Confirmation No. 4990

Appl. No. 09/584,796

TC/A.U. 2643

Filed: June 1, 2000

Examiner: Jamal, Alexander

For: A FREQUENCY DOMAIN ECHO CANCELLER

November 9, 2005

Mail Stop AF Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

STATEMENT OF ARGUMENTS IN SUPPORT OF PRE-APPEAL BRIEF REQUEST FOR REVIEW OF THE REJECTIONS BASED ON HO OR CHAFFEE COMBINED WITH DOWLING

The independent claims (except claims 20 and 30 dealt with later) recite "estimat[ing] in the frequency domain an echo signal" and "remov[ing] in the frequency domain the estimated echo signal in the frequency domain from a received signal in the frequency domain." Chaffee disclose an echo canceller in which the estimated echo is converted to the time-domain and subtracted from the received signal. Ho relies primarily on echo cancellation in the time domain. See lines 10-13 of col. 6: "After the adder 52 subtracts the time-domain portion of the echo, e(n), the output is converted by a serial-to-parallel (S/P) converter 54 into a block of N realvalued time-domain samples." Then a residual echo is converted from the time to the frequency domain so that a residual echo E(f) is removed. Hence, the main echo is removed in the timedomain, and then the result is corrected in frequency-domain. The reason Ho takes this approach is that Ho does not (and can not) remove the echo due to a previous symbol in the frequency domain.

The Examiner admits that Ho and Chaffee lack estimating the echo signals in the frequency domain using a combination of (i) a product of a first matrix of coefficients in the frequency domain and a transmitted symbol and (ii) a product of a second matrix of coefficients in the frequency domain and a previously-transmitted symbol. The Examiner relies on Dowling to remedy their deficiencies. That reliance is misplaced.

Dowling describes a pre-equalizer—not an echo canceller. Dowling *precodes* a signal *before* the signal is transmitted in order to compensate for <u>transmission channel distortion</u> (not echo) that would otherwise distort the signal received at the intended receiver (i.e., the far-end transceiver). The hope is that this precoded signal will be received without the receiver having to equalize the signal. In other words, Dowling tries to compensate for the channel distortion before transmission so that the signal is received more or less undistorted by the channel.

Dowling is concerned about the far-end receiver and the received signal.

In contrast, the claimed echo cancellation is at the <u>near-end</u> transceiver, and the echo that the <u>near-end</u> transceiver must deal with is reflected back to the <u>near-end</u> transceiver. These basic facts would be well understood by those skilled in echo cancellation. While Dowling effectively pre-equalizes (precodes) the transmitted signal for the transmission channel in order to simplify signal processing in the far-end transceiver, the instant claims remove echo in the near-end transceiver caused by the near-end transmitted signal. These are two very different problems.

<u>Compensating For Channel Distortion Does Not Compensate For Echo</u>. Dowling's precoder does not estimate and remove an echo signal from a received signal—let alone do this in the frequency domain. Rather, Dowling estimates and "removes" the expected transmission

channel distortion from the transmitted signal so that distortion introduced by the transmission channel will be minimized at the receiver. Dowling's channel distortion estimate *does not include echo cancellation*. Echo is caused by transmission line impedance mismatches, which is different from the channel transfer function. Echo is experienced at the <u>near-end</u> transmitter, and not at the <u>far-end</u> receiver, which is where Dowling's precoding goal is. Why would Dowling model/estimate an echo that is not part of the channel distortion of the signal received at the far end receiver? Echo is a problem for the near-end transceiver to deal with and not the far-end transceiver.

The Examiner relies on col. 22, lines 1-3, where Dowling states that "communication systems often involve other elements such as echo cancellers which may be advantageously merged with the precoder." But here *Dowling admits that his precoder/pre-equalizer does not perform echo cancellation*. If you want to cancel echo, Dowling explicitly states that you need to use an echo canceller because his precoder will not. Thus, the Examiner's premise that Dowling's precoder somehow removes the echo from the transmitted signal cannot stand.

The Ho/Chaffee/Dowling Combinations Fall Short. Even if Dowling's precoder were "merged" with Ho's or Chaffee's echo canceller, one would not arrive at the claimed echo cancellation. Dowling's precoder, by Dowling's own admission, does not perform echo cancellation. Hence, in the Examiner's proposed combination, it is just Ho's echo canceller doing the echo cancellation, which the Examiner rightly admits is not the claimed echo cancellation. So the proposed combination fails.

To cancel echo (which is not transmitted over the transmission channel), a model of the echo is needed; a model of the transmission channel is not. On the other hand, Dowling's precoding modifies the transmitted signal using an inversion of the transmission channel transfer

LINDQVIST et al. Appl. No. 09/584,796 November 9, 2005

function. The hoped for result is the receiver gets a signal that is more or less unaffected by the channel transfer function. But only knowledge of the transmission channel is needed and not the echo experienced at the near-end. And because the echo is removed from the transmitted signal in the merged combination, its not part of the transmitted signal—nor is it part of the channel.

The Ho/Chaffee/Dowling Combinations Would Not Be Made. Notwithstanding the significant deficiencies already noted, assume for the sake of argument that there were some provision by Dowling to precode the signal to be transmitted for echo cancellation—which Dowling plainly does not do—along with precoding for the transmission channel. The echo would be modeled and then inverted (call this X) just like the transmission channel is modeled and inverted (call this Y). But the consequence is that the inverted echo model X negatively affects the inverted channel model Y resulting in distorting the received signal even more at the far-end receiver! That is why this modification would not be made. Further distorting of the signal at the far-end receiver and the need for more sophisticated equalization at the far-end receiver are the very things Dowling is trying to avoid. The Federal Circuit has clearly stated that a proposed modification that renders a reference inoperable for its intended purpose is an inappropriate foundation for an obviousness rejection. *In re Gordon*, 733 F.2d 900, 902 (Fed. Cir. 1984).

Consider the alternative combination where Dowling's precoded signal is directly applied to the input of Ho's echo canceller. In that case, that applied signal is still only compensated for transmission channel ISI and ICI. The echo ISI and ICI would not be compensated for, but instead would be additionally distorted. Accordingly, Ho's echo canceller cannot be combined with Dowling's precoder in the manner proposed by the Examiner to result in the claimed echo canceller. Such a proposed combination certainly does not result in estimating a echo signal in

LINDOVIST et al. Appl. No. 09/584,796

November 9, 2005

the frequency domain using the claimed combination of first and second matrices using by a

transmitted symbol and a previously-transmitted symbol.

Ho And Dowling Do Not Compensate for Echo ICI or ISI. The frequency domain

echo canceler in claim 30 "estimate[s] the echo in the received signal using a frequency domain

model of an echo path channel that includes effects of intersymbol interference and inter-carrier

interference and to subtract the echo estimate from the received signal to provide a difference."

See also claims 20 and 21. None of the applied references teach an echo canceller that takes into

account effects of echo inter-carrier interference (ICI) and inter-symbol interference (ISI) in a

frequency domain model in an echo estimate so that it can be subtracted out from the received

echo at the transmitter.

The Examiner assumes that ICI is a form of either ISI or noise. To the contrary, as

explained in the background of this application, ICI is not the same as ISI. Nor is ICI a form of

"noise." Two articles previously provided to the Examiner demonstrate this fact.

A fundamental point ignored by the Examiner is that the ISI and ICI in the transmitted

signal are not the same as the ISI and ICI in the echo. None of the applied references model or

compensate for the echo ISI and echo ICI.

Respectfully submitted,

NIXON & VANDERHYE P.C.
